

BR_Overview

Revision history

2021-03-16	Don Ferguson	Original draft
------------	--------------	----------------

SCOPE

The documents previously contained in the 07.xx series of HRE documentation have been largely removed due to their redundancy.

Certain specifications for already implemented functions have been retained.

As described in *03.01 HRE Architecture Layers and API design (Build 23) 2020-08-12* (or subsequent versions) the methods by which the GUI layer interacts with the Business Layer have been heavily revised during implementation. Thus the original BR specifications for functions to be performed in the Business Layer are largely redundant.

As described in the above document, functions performed in the Business Layer are implemented in a series of modules such as:

- HBProjectHandler
- HBPersnHandler
- HBResearchHandler
- HBViewpointHandler
- HBEvtTaskHandler
- HBWhereWhenHandler
- HBEvidenceHandler
- HBReportHandler
- HBToolHandler

plus certain specific functions performed by HB0711Logging and HB0744UserAUX.
