# GUI\_PatternDefnSelect - Pattern Definition Select

Robin Lamacraft 2017-03-19

#### **SCOPE**

Patterns Definition instances are used as controlling structures for the creation and use of Node Entities within HRE. The Pattern Definitions are aligned with the Node Entities within HRE. This GUI module displays in a tabular display all Pattern Definitions of one particular Node Entity Type. There a number of Purposes identified for Patterns in HRE.

### **Scope Variations:**

Node Entity Type	Node Entity Differences
ITEM	(hidden)
-> External File	
-> Image	
-> Internal Text	
-> Another Item Type	(like Artworks)
-> Biological	(hidden)
->-> Person	
->-> Another Bio Type	(like Plants)
GROUP (hidden)	(hidden)
-> Event	
-> Task	
-> Location	
-> Repository	
-> Source	
-> Another Group Type	(like Organizations)

The Pattern Definition instances store the control data to create Node Entity instance. Initially, this GUI\_PatternDefnSelect screen lists <u>all</u> Patterns Definition instances of that Node Entity Type. Later in the development, once Filters are implemented, a filter may be used to reduce the number of objects that are displayed. This screen allows for the creation of a new Pattern, either from scratch or as a clone of an existing Pattern.

### **LOOK AND FEEL**

The screen has 2 sections:

- Heading section:
  - The Node Entity Type (focus preset selection available)
  - A collection of command buttons
    - "Configure" to access the configuration alternatives for this screen
    - "Output" to open a screen that will output the contents of the Pattern List as a file or print it. Later, when Subsets are implemented, the rows of tabular screens will each have a checkbox, that will select marked rows for printing, deletion or to create a subset of their HRE-IDs.
- Pattern Definition List section:
  - At its top, a collection of command buttons:
    - "Add New" creates an empty Pattern Definition instance with a new ID
    - "Add Clone" copies the selected Pattern Definition instance with a new ID
    - "Edit" opens the GUI\_PatternDefnEdit screen to edit the selected Pattern Definition instance

- "Delete" opens the GUI\_PatternDefnDelete screen to delete the selected Pattern Definition instance.
- o A scrollable resizable tabular display with one row per Pattern Definition instance
  - Common columns available
    - Pattern Definition instance Visible ID
    - Pattern Definition instance Primary or Selected Name (if it has a name)
    - Any other common Pattern Definition data.
- The choice of displayed fields and their format and order is specified in the screen opened by the "Configure" button. Here previously saved configurations can be selected or a new configuration created
- Clicking on a row of the table selects that Pattern Definition instance
- Double-clicking on a row of the table open the GUI\_PatternDefnEdit screen on that selected definition
- Initially, there will be an ability to sort the rows on one column, but later that feature will be extended to allow sorting on several columns at once.

## [Needs a mockup diagram here]

#### **METHODS**

The fundamental operations are:

- 1. Open the Screen according to its saved Screen Layout (BR PanelConfig)
- 2. Populate the tabular display with values for the focus type
- 3. Click on a row to select an object
- 4. "Output" will save the table as a file or print it.

### **USED BY:**

1. Any data type using Pattern Definitions that has a GUI-PatternDefnSelect variant. Because these are GUI elements that create events which must be directed to the single place where each is acted upon, each of these GUI screens must have unique identities. This means that the basic screen layout can be defined as an abstract class where each separate real class contains the object type specific code when listening for events.

#### **DATA CONTROLLED BY THIS MODULE:**

1. None.

## **REQUIRED DATA CONTROLLED BY OTHER MODULES:**

- 1. HRE ID
- 2. Panel Configuration.

### **REQUIRED SERVICES**

- 1. GUI\_PanelConfig
- 2. GUI\_TadEdit
- 3. GUI\_PatternDelete
- 4. GUI Output
- 5. BR Settting
- 6. BR UserTranslation
- 7. BR PanelConfig
- 8. BR EntityLink
- 9. BR Pattern.

# **APPLICATION PROGRAMMING INTERFACE (API)**

1. Need Details.

## **EVENT ACTIONS**

1. Need details of event (keyboard or mouse) and the description of the action.

## **WARNING CONDITIONS**

1. Need details of the condition that raised the warning, example message and possible next steps.

## **ERROR CONDITIONS**

1. Need to record the condition that raised the error, example message and possible next steps.
