BR_MENU – Menu Services

Robin Lamacraft 2017-02-21

SCOPE

This module must be used to configure menus:
- the Application Main Menu
- any Context Sensitive Menu in HRE.

To start the use of these services the calling object may be:
1. the head code of an application (to create a new main menu)
2. an object that needs a context sensitive menu.

In each case, the return is the unique Menu Item ID

Subsequent methods will use this ID as a parameter.

METHODS

1. Create an application or a context menu
2. For the application menu, create a menu item on a clipboard
3. Provide an installation persistent ID for that menu item
4. Insert a clipboard menu item as a record in a GUI database with that ID
5. Set the type of the menu item
6. Paste a clipboard entry before or after the current item as a sibling entry
7. Append a clipboard entry after the current item as a child of the current entry
8. Delete a current item and its dependent items
9. Cut the current item with its dependents to the clipboard
10. Copy a menu Item to a clipboard
11. Set the actions to be performed when a menu item is selected. These are stored in the GUI database.

Notes:

The GUI ID is used to lookup:
- GUI translations for any text content about that Menu Item
- GUI operations with this menus entry.
